

# JCMOVES Treasury Staking Architecture (One-Page Overview)

Reference: <https://www.jconthemove.com/staking>

**Goal:** Upgrade the existing JCMOVES staking system to a scalable treasury-backed model that combines token staking, Ethereum validator staking, and real revenue yield distribution.

**Current System:** Tier-based static APR staking.

| Tier     | APR |
|----------|-----|
| Flexible | 5%  |
| Bronze   | 10% |
| Silver   | 15% |
| Gold     | 20% |
| Diamond  | 30% |

**Issue With Static APR:** Rewards do not scale with treasury revenue or usage. High staking growth could inflate supply if treasury inflows do not keep up.

## ***Proposed Hybrid Yield System***

Layer 1 – Base APR (low guaranteed yield): 3–12% depending on tier.

Layer 2 – Treasury Bonus: Dynamic yield distributed from company revenue sources.

## ***Treasury Yield Sources***

- Moving company revenue
- Website service sales
- Token fees
- Ethereum validator rewards
- Arbitrage trading bots
- Pi Network app revenue

## ***Split Staking Page Concept***

[ JCMOVES TOKEN STAKING ] | [ ETH VALIDATOR STAKING ]

## ***Ethereum Validator Pool***

Users deposit ETH → pooled until 32 ETH → validator launched → rewards earned → JC ON THE MOVE takes validator fee (≈10–15%) → remaining yield distributed to users.

## ***Suggested UI Improvements***

- Treasury Yield Source dashboard
- Dynamic APY meter (Base APR + Treasury Bonus)
- Pool statistics (Total stakers, rewards paid, treasury inflow)
- Auto-compound toggle
- Treasury transparency page (wallets, payouts, validator uptime)

## ***Future Expansion***

Multi-asset staking support: JCMOVES / ETH / SOL / USDC with rewards distributed from the company treasury ecosystem.

## ***Strategic Vision***

JC ON THE MOVE Treasury Protocol — a real■business■backed staking ecosystem where moving services and digital revenue feed a decentralized yield pool.
