

JC ON THE MOVE

Multi-Service Booking Flow • Featured Bundles • Replit Update PDF

Goal

Let one customer book one service or multiple services in a single checkout, surface high-converting featured bundles, and price add-ons so smaller jobs increase ticket size without causing friction.

1. Core Product Direction

The booking flow should treat every job as a service package first, then let the customer stack extra services before checkout.

This changes the site from a single-service estimator into a revenue-maximizing booking engine:

- Customer chooses a primary service: Moving, Junk Removal, Labor, Cleaning, Lawn, Snow, Delivery, Assembly, Haul-Away.
- System offers featured bundles immediately after the primary service is selected.
- Customer can add small-job extras such as junk removal, furniture assembly, appliance move-out, light cleaning, or packing support.
- Pricing engine applies bundle savings automatically instead of forcing customers to calculate discounts themselves.
- Checkout shows one total, one schedule, one crew recommendation, and one JCMOVES reward estimate.

2. Recommended Customer Flow

Flow Stage	What Happens
Step 1 — Service Entry	Customer lands on a clean service selector with big visual cards and chooses the main job type.
Step 2 — Job Details	Collect the core details only for the main service first: address, date, size, urgency, and any photos or notes.
Step 3 — Bundle Offer Screen	Before pricing is finalized, show 3 featured bundles and 4 to 6 quick add-ons. This is the money layer.
Step 4 — Add-On Configuration	If the customer taps an add-on, open a small detail drawer instead of forcing a new page.
Step 5 — Live Summary	Right panel or sticky mobile footer updates subtotal, bundle discount, crew size, and token rewards in real time.
Step 6 — Checkout	Customer confirms date, contact details, payment or deposit, and receives one combined order.
Step 7 — Ops Routing	Backend splits the order into service line items while preserving one parent booking for admin, customer, and crew views.

3. Featured Bundles to Push Hard

Bundle	Includes	Why It Converts	Discount Target
Move + Junk Reset	Moving + junk haul-away	Ideal when a customer is relocating and wants unwanted items removed the same day.	8% to 12%
Move + Assembly Finish	Moving + furniture assembly	Best for beds, desks, shelving, entertainment centers, and quick setup after move-in.	8% to 10%
Junk + Deep Clean Turnover	Junk removal + light or deep cleaning	Strong for apartments, rentals, property managers, and estate cleanouts.	10% to 15%
Labor + Delivery + Assembly	Pickup/delivery + in-home placement + assembly	Perfect for Facebook Marketplace, store pickups, and appliance or furniture installs.	Bundle flat-rate
Snow + Walkway Priority	Driveway service + walkway/entry cleanup	Fast seasonal add-on that increases average order value on routine jobs.	Flat seasonal bundle

Best merchandising rule

Always show one "Most Popular" bundle, one "Best Value" bundle, and one "Fast Add-On" option. That keeps the screen simple while still driving a larger average ticket.

4. Add-On Pricing Framework for Smaller Jobs

For smaller jobs, keep add-ons easy to understand and anchored in a narrow range. The user asked for most small-job add-ons to live around \$200 to \$400, with larger jobs priced higher but still discounted when bundled.

Add-On	Suggested Small-Job Price	Trigger / Notes
Small Junk Removal Add-On	\$200–\$300	1 to 6 small items or a light trailer/pickup load add-on during another booked service.
Furniture Assembly Add-On	\$200–\$350	Beds, desks, shelving, dressers, and standard in-home setup while crew is already on-site.
Move-In / Move-Out Light Cleaning	\$250–\$400	Quick reset clean for kitchens, bathrooms, floors, and wipe-down service.
Packing / Unpacking Block	\$200–\$350	Small packaging block or post-

		move unpack support.
Appliance / Heavy Item Handling	\$200–\$400	One-off heavy item add-on with access risk or special handling.

Larger jobs can exceed these ranges, but the system should still show bundle savings automatically. Example: a \$600 add-on may display as \$525 when paired with a premium move package.

5. Pricing Engine Rules

- Primary service keeps its own pricing logic.
- Every add-on becomes a service line item with base price, discountable flag, labor estimate, and crew role requirement.
- Bundle discount applies only when the right combination of services is present.
- Small-ticket add-ons can use flat pricing. Larger add-ons can switch to tiered or estimate-based pricing.
- Set a maximum total discount guardrail so margin does not get squeezed on low-profit jobs.
- Display savings as a line item: Bundle Savings –\$X.

Recommended discount logic

- 2-service bundle: 8% off qualifying add-on or flat savings of \$25–\$75.
- 3-service bundle: 10% to 12% off qualifying secondary services.
- Premium house package or property turnover package: custom bundle pricing with a visible "Best Value" label.
- Operational override: admin can remove discount if crew complexity, distance, or disposal costs make margin too thin.

6. Data Model

Use one parent booking with many child service items. That keeps checkout simple for the customer while preserving detailed ops logic.

- bookings: id, customer_id, status, booking_date, service_address, subtotal, discount_total, final_total, token_reward_estimate
- booking_service_items: id, booking_id, service_code, label, quantity, base_price, discount_amount, final_price, metadata_json
- bundle_definitions: id, slug, title, description, service_combo_json, discount_type, discount_value, is_featured
- service_catalog: service_code, title, category, default_price_mode, active, display_order
- crew_requirements: service_code, movers_needed, truck_needed, trailer_needed, specialty_flags

7. Frontend Components

Component	Purpose
ServiceSelector	Large visual cards for primary services.
BundleOfferStrip	Featured bundle cards with savings badges.
AddOnDrawer	Quick-select extra services without leaving the

	booking flow.
BookingSummarySticky	Real-time total, savings, and JCMOVES reward estimate.
BundleBadge	Most Popular / Best Value / Seasonal tag.
ServiceItemEditor	Lets customer adjust quantity, scope, or notes on each selected item.

8. Backend Flow

- Validate the primary service request.
- Look up qualifying bundles from `bundle_definitions`.
- Return featured offers and quick-add recommendations based on service type.
- When customer adds services, build a normalized quote object.
- Apply discount engine and produce final booking summary.
- Persist parent booking plus child service items.
- Trigger crew recommendation, admin notifications, and token reward estimate.

9. JCMOVES Reward Integration

- Issue rewards on the parent booking total after any approved discount is applied.
- Optional bonus multiplier for featured bundles to encourage stacked bookings.
- Keep reward logic separate from pricing logic so you can tune promotions later without rewriting checkout.
- Expose reward estimate in summary before checkout and finalized reward after booking is confirmed.

10. Replit Update Checklist

- Add `bundle_definitions` and `booking_service_items` tables or equivalent schema.
- Update service catalog to include add-on metadata and discount eligibility.
- Build or patch the booking API so it accepts an array of service items, not just one service.
- Create featured bundle response payloads for the frontend.
- Add pricing utility that computes subtotal, discounts, and final total in one place.
- Patch customer dashboard and admin dashboard to show one parent booking with expandable child services.
- Surface JCMOVES estimate in checkout summary.
- Test one-service booking, two-service bundle, three-service bundle, and admin override cases.

Deployment note

For Replit production, confirm `NODE_ENV`, `REPLIT_DOMAINS`, `DATABASE_URL`, session/auth secrets, and any token-related secrets before pushing the updated booking flow live.

11. Recommended Build Order

- Phase 1: data model + pricing engine
- Phase 2: featured bundle UI + add-on drawer

- Phase 3: booking API accepts multiple services
- Phase 4: admin and customer booking views
- Phase 5: token reward multipliers, upsell experiments, and analytics

12. Final Implementation Position

The strongest version of this system is not just multi-service booking. It is a guided bundle engine: customers choose a main job, the platform recommends the smartest add-ons, pricing stays simple, and operations still receive structured service items behind the scenes.

That gives JC ON THE MOVE a cleaner checkout, larger average order value, stronger seasonal packaging, and an easier path to scaling services without making the booking flow feel crowded.
